Nov/27/17

Tree Common Name: Ginkgo/Maidenhair

Tree Scientific Name: Ginkgo biloba

Tree Number: 44

Location: Walgreen Hall lawn

Height: 19 Meters

DBH: 66 cm

Radius of Crown: 4.5

Condition: Middle condition

Dates of Observation: Sep 14th, October 14th, Nov 27th

Observation 1

Sep 14th

Summary: The tree has a white/grey colored bark that has slits in it. The branches of the tree are high up and the leaves on the branches are green. The trunk of the tree is very wide and the height seems to be greater than most trees which leads me to believe this is an older tree.

Observation 2

October 14th

Summary: The tree is beginning to loose it's leaves on the branches, the bark is still the same color it was in September. The leaves have just begun to fall off the branch and i think in about a month all the leaves will have fallen off. I also see a few branches missing from the tree that were there last time, perhaps from strong winds.

Observation 3

Nov 27th

Summary: The tree has lost all it's leaves and all the branches are now bare. When you look up there's no longer any leaves preventing you from seeing the sky. The bark is the same color and it looks like the tree is ready for the wintertime.
